

Aluminum composite

Published on 4 June 2019

Several methods already exist to color aluminum like anodizing or application of a coating, but those methods only color aluminum at the surface, making the material non-machinable once colored and really sensitive to scratches.

To respond to luxury industry demands, Biodesiv team has developed an aluminum composite material that is completely colorable, machinable, lighter and respect high-quality standards criteria of the industry.

This hybrid composite offers many different possibilities for different industries and is fully customizable for your application.
